

Meal Picker using Python

Abstract

This project is a simple Python application that helps users decide what to eat by randomly selecting a food item from a predefined list. It demonstrates the use of randomization and user interaction.

Aim

To write a Python program that randomly selects a food item from a list and helps decide what to eat.

Algorithm

1. Import random module. 2. Create a list of food items. 3. Ask user to press Enter. 4. Use random.choice() to pick a food. 5. Display the result.

Code Implementation

```
import random

def meal_picker():
    options = [
        "Sushi",
        "Tacos",
        "Italian Pasta",
        "Burgers",
        "Thai Curry",
        "Mediterranean Salad",
        "Breakfast for Dinner",
        "Pizza"
    ]

    print("--- The 'What Should I Eat?' Picker ---")
    input("Press Enter to let fate decide...")

    selection = random.choice(options)

    print(f"Decision made! You should have: {selection}")

if __name__ == "__main__":
    meal_picker()
```

Output

```
--- The 'What Should I Eat?' Picker ---
Press Enter to let fate decide...

Decision made! You should have: Pizza
```

Conclusion

This project shows how randomization can be used in Python to create simple decision-making applications.
